

IN THE CLAIMS

Please amend the claims as follows:

Claim 1 (Currently Amended) A container storage box for storage of a deformable container which comprises a flexible region and is capable of discharging fluidity contents for image formation when placed into a container loading part of an image forming apparatus, the container storage box comprising sidewall faces which ~~are rigid to prevent random~~ deformation of the deformable container during storage,

wherein characterized in that said sidewall faces are provided configured to regulate a configuration of the deformable container in a configuration accommodated in the container loading part, when the deformable container is placed in the image forming apparatus

wherein the container storage box comprises a plurality of sidewall faces, at least two opposing ones of the plurality of sidewall faces regulating the configuration of the container and fixing a position of the container by contact-surface resistance with the container during storage, and

wherein a first pair of said at least two opposing sidewall faces not being parallel to each other, and a gap between the first pair of said at least two opposing sidewall faces is gradually tapered, and a second pair of said at least two opposing sidewall faces not being parallel to each other, and a gap between the second pair of said at least two opposing sidewall faces is gradually tapered.

Claim 2 (Canceled).

Claim 3 (Original) The container storage box according to claim 1 characterized in that space is provided at an upper part of the container contained in the container storage box.

Claim 4 (Canceled).

Claim 5 (Currently Amended) The container storage box according to claim [[4]]1 characterized in that the container storage box comprises an opening face which is different from the plurality of sidewall faces and located at one of sides of said at least two opposing sidewall faces where a gap is larger than at the other side of said at least two opposing sidewall faces.

Claim 6 (Original) The container storage box according to claim 5 characterized in that a tongue-shaped lid piece which is foldable to open or close said opening face is provided via a hinge part in said opening face, and a flap which is rotatable in a direction to open or close said opening face is provided via a hinge part at a position opposed to said tongue-shaped lid piece in said opening face, and the hinge part of said flap includes an insertion opening for inserting said tongue-shaped lid piece.

Claim 7 (Original) The container storage box according to claim 6 characterized in that a cutout is formed in a base of an insertion part of said flap where said tongue-shaped lid piece is inserted.

Claims 8-9 (Canceled).

Claim 10 (Currently Amended) The container storage box according to claim 1, ~~characterized in that the container storage box comprises~~ further comprising:

_____an opening face which is different from the plurality of sidewall faces and located at one of sides of said at least two opposing sidewall faces where a gap is larger than at the other side of said at least two opposing sidewall faces, and
_____a small-area face which is different from the plurality of sidewall faces and opposite to the opening face.

Claim 11 (Original) The container storage box according to claim 10 characterized in that the small-area face is located in the middle of a sheet material which is produced when the container storage box is disassembled.

Claim 12 (Currently Amended) The container storage box according to claim [[4]]1 characterized in that the container storage box comprises a projection provided at a side of said one of said at least two opposing sidewall faces.

Claim 13 (Original) The container storage box according to claim 5 characterized in that a ridgeline where one of said at least two opposing sidewall faces and the opening face intersect by an acute angle serves as a hinge of the opening face.

Claim 14 (Currently Amended) The container storage box according to claim [[4]]1 characterized in that the container storage box comprises an indication about the contents of the container, and the container storage box with the indication being arranged so that a slanting one of said at least two opposing sidewall faces is placed upside.

Claim 15 (Currently Amended) The container storage box according to claim [[4]]1 characterized in that the container storage box comprises a first indication which identifies

the contents of the container, and a second indication which indicates how to handle the container and the contents of the container, and the container storage box with the first and second indications being arranged so that the first indication is placed on one of said at least two opposing sidewall faces and the second indication is placed on the other face.

Claim 16 (Original) The container storage box according to claim 13 characterized in that an indication is provided on the opening face, and the container storage box with the indication being arranged so that the hinge of the acute angle ridgeline is placed upside of the indication.

Claim 17 (Original) The container storage box according to claim 1 characterized in that the sidewall faces are made of a sheet material which is bendable to form the container storage box, and perforations are provided on the sheet material without affecting a strength of the container storage box in an assembly state.

Claim 18 (Original) The container storage box according to claim 13 characterized in that perforations are provided on the ridgeline without affecting a strength of the container storage box in an assembly state.

Claim 19 (Original) The container storage box according to claim 1 characterized in that the container storage box comprises a shock absorbing material which secures the deformable container by contact-surface resistance, and the container storage box is in a configuration of a rectangular prism.

Claim 20 (Currently Amended) The container storage box according to claim 1 characterized in that the container storage box comprises a partial lamination end, and rounded surfaces [[R]] are provided at bending portions on a side of inner walls of the box and at the partial lamination end.

Claim 21 (Original) The container storage box according to claim 1 characterized in that the container storage box is made of either a cardboard material or a corrugated cardboard material.

Claim 22 (Original) The container storage box according to claim 1 characterized in that the deformable container is either a toner storage container or a developer storage container.
